Chapter 1

Interpolactic

BOILERPLATE, BEGONE!

[Interpolactic](#) takes the pain out of Coroutine-based animations by bundling the boilerplate of a time-based `IEnumerable` into a composable, reusable builder.

All [Interpolactic](#) needs is a function or closure that acts upon a time value ranging from 0 to 1.

Fading in a `CanvasGroup`'s alpha can be done in just a few keystrokes:

```
new Interpolation(t => canvasGroup.alpha = t) //Set alpha to t at each time step
    .Duration(1) //1 second
    .Build(this) //Build a runner for this interpolation using this MonoBehaviour
    .Play(); //Fire!
```

Animating a transform's position can be done similarly:

```
Vector3 start = transform.position;
Vector3 movement = target.transform.position - start;

new Interpolation(t => transform.position = start + movement * t)
    .Duration(1)
    .Build(this)
    .Play();
```

ANIMATE ANYTHING

The beauty of [Interpolactic](#) is that the caller declares the implementation by defining what happens at every time step. While many other plugins restrict interpolation to common types such as float and Color, [Interpolactic](#) simply needs an action to perform with respect to time.

For example, we can use caller-defined interpolation across a string to add a "typing" effect:

```
string str = "abcdefg";

new Interpolation(t =>
{
    int substringLength = (int) t * str.Length;
    textField.text = str.Substring(0, substringLength);
})
    .Duration(1)
    .Build(this)
    .Play();
```

PAIN-FREE PLAYBACK

The actual Coroutine is then wrapped in a Runner object that offers a kit of utility methods to control playback.

```
void TogglePlaying()
{
    if(animation.playing)
        animation.Pause();
    else
        animation.Play();
}
```

3.1.1 Detailed Description

The `IPInterpolation` class acts as a template for Coroutines to act on a callback with a time value from 0 to 1.

The `IPInterpolation` doesn't generate a `IPRunner` until `Build()` is called on it. Therefore, for repeated animations an `IPInterpolation` can be kept and tweaked, generating a new `IPRunner` with every `Build`.

3.1.2 Constructor & Destructor Documentation

3.1.2.1 `Interpolation()` [1/2]

```
Interpolactic.Interpolation.Interpolation ( )
```

Create a new `Interpolator` with no actions.

3.1.2.2 `Interpolation()` [2/2]

```
Interpolactic.Interpolation.Interpolation (
    Action< float > action )
```

Convenience initializer for a new `Interpolator` with a single action.

3.1.3 Member Function Documentation

3.1.3.1 `AddAction()`

```
Interpolation Interpolactic.Interpolation.AddAction (
    Action< float > stepAction )
```

Create a clone of `Interpolation` object, with an additional action to be called each time step. All existing actions registered to the `Interpolation` will be preserved.

Parameters

<code>stepAction</code>	Action to be called at each time step in the interpolation.
-------------------------	---

3.1.3.2 `Build()`

```
Runner Interpolactic.Interpolation.Build (
    MonoBehaviour monoBehaviour )
```

Creates a [Runner](#) object for the [Interpolation](#).

Parameters

<i>monoBehaviour</i>	The MonoBehaviour object to be used as the starter and stopper for the Runner 's internal Coroutine.
----------------------	--

3.1.3.3 Completion()

```
Interpolation Interpolactic.Interpolation.Completion (
    Action onComplete )
```

Create a clone of [Interpolation](#) object with a callback to be invoked when the interpolation has run to completion. The completion action will not be called if the interpolation is stopped manually.

Parameters

<i>onComplete</i>	Action to be called when interpolation completes.
-------------------	---

3.1.3.4 Delay()

```
Interpolation Interpolactic.Interpolation.Delay (
    float delay )
```

Create a clone of [Interpolation](#) object with a specified delay before execution.

Parameters

<i>delay</i>	Delay of interpolation in seconds.
--------------	------------------------------------

3.1.3.5 Duration()

```
Interpolation Interpolactic.Interpolation.Duration (
    float duration )
```

Create a clone of [Interpolation](#) object with a specified duration.

Parameters

<i>duration</i>	Duration of interpolation in seconds.
-----------------	---------------------------------------

3.1.3.6 EasingFunction()

```
Interpolation Interpolactic.Interpolation.EasingFunction (
    Func< float, float, float, float > easingFunction )
```

Create a clone of [Interpolation](#) object with an easing function.

Parameters

<i>easingFunction</i>	Easing function, such as <code>Mathf.SmoothStep</code>
-----------------------	--

3.1.3.7 FirstStepBeforeDelay()

```
Interpolation Interpolactic.Interpolation.FirstStepBeforeDelay (
    bool firstStepBeforeDelay )
```

Create a clone of [Interpolation](#) object with `firstStepBeforeDelay` enabled or disabled.

Parameters

<i>firstStepBeforeDelay</i>	Should the interpolation act on t=0 before performing the delay?
-----------------------------	--

3.1.3.8 OnStop()

```
Interpolation Interpolactic.Interpolation.OnStop (
    Action< float > onStop )
```

Create a clone of [Interpolation](#) object will a callback to be invoked when the interpolation has been stopped manually.

Parameters

<i>onStop</i>	Action to be called if interpolation is stopped.
---------------	--

3.1.3.9 PingPong()

```
Interpolation Interpolactic.Interpolation.PingPong (
    bool pingPong )
```

Create a clone of [Interpolation](#) with ping-pong enabled or disabled.

Parameters

<i>pingPong</i>	should the interpolation ping-pong?
-----------------	-------------------------------------

3.1.3.10 RealTime()

```
Interpolation Interpolactic.Interpolation.RealTime (
    bool realTime )
```

Create a clone of [Interpolation](#) object with real time enabled or disabled.

Parameters

<i>realTime</i>	Should the interpolation run in real time?
-----------------	--

3.1.3.11 Repeats()

```
Interpolation Interpolactic.Interpolation.Repeats (
    bool repeats )
```

Create a clone of [Interpolation](#) with repeating enabled or disabled.

Parameters

<i>repeats</i>	Should the interpolation repeat?
----------------	----------------------------------

3.1.4 Property Documentation

3.1.4.1 delay

```
float Interpolactic.Interpolation.delay [get]
```

Length in seconds that the [Interpolation](#)'s runner will wait before beginning interpolation.

Defaults to 0.

3.1.4.2 duration

```
float Interpolactic.Interpolation.duration [get]
```

Length in seconds of the [Interpolation](#) over time.

Defaults to 0.

3.1.4.3 firstStepBeforeDelay

```
bool Interpolactic.Interpolation.firstStepBeforeDelay [get]
```

If true, the [Interpolation](#)'s step at t=0 will be called before the delay is applied. Useful for holding an animation at its initial state while waiting for the delay to end.

Defaults to false.

3.1.4.4 pingPong

```
bool Interpolactic.Interpolation.pingPong [get]
```

If true, the interpolation will play itself back in reverse after finishing its first pass.

Can be combined with `realTime` to ping-pong indefinitely.

Defaults to false.

3.1.4.5 realTime

```
bool Interpolactic.Interpolation.realTime [get]
```

If true, the interpolation will execute independently of `Time.timeScale`.

Defaults to false.

3.1.4.6 repeats

```
bool Interpolactic.Interpolation.repeats [get]
```

If true, the associated [Runner](#) will repeat until stopped.

Defaults to false.

The documentation for this class was generated from the following files:

- `/Users/max/Dev/Interpolactic/Assets/Interpolactic/Source/Interpolation.Runner.Coroutine.cs`

3.2 Interpolactic.Interpolation.Runner Class Reference

Public Member Functions

- virtual void [Stop](#) ()
- virtual void [Play](#) ()
- virtual void [Pause](#) ()

Protected Member Functions

- abstract float [DeltaTime](#) (bool [realTime](#))
- IEnumerator< float > [PerformInterpolation](#) ()

Protected Attributes

- [Interpolation](#) [interpolation](#)

Properties

- bool [finished](#) [get]
- bool [playing](#) [get]
- bool [stopped](#) [get]
- bool [started](#) [get]

3.2.1 Detailed Description

A [Runner](#) is required to execute an [Interpolation](#). The [Runner](#) class not only handles handles the implementation of an [Interpolation](#), but offers a suite of functions for playback control.

Runners don't start automatically, and so to start a runner the caller must invoke [Play\(\)](#) to perform the [Interpolation](#).

3.2.2 Member Function Documentation

3.2.2.1 DeltaTime()

```
abstract float Interpolactic.Interpolation.Runner.DeltaTime (
    bool realTime ) [protected], [pure virtual]
```

The interval in seconds since the last frame.

3.2.2.2 Pause()

```
virtual void Interpolactic.Interpolation.Runner.Pause ( ) [virtual]
```

Suspends playback on the [Runner](#). Resources are still allocated in a paused [Runner](#), so be sure to only call [Pause\(\)](#) if planning on resuming the animation.

3.2.2.3 PerformInterpolation()

```
IEnumerator<float> Interpolactic.Interpolation.Runner.PerformInterpolation ( ) [protected]
```

IEnumerator for the actual interpolation of t from 0 to 1. Will perform the [Interpolation](#) in its entirety then call the onComplete callback, if defined.

3.2.2.4 Play()

```
virtual void Interpolactic.Interpolation.Runner.Play ( ) [virtual]
```

Begins or resumes playback on the [Runner](#).

Warning

Will throw an exception if the [Runner](#) has already been stopped.

3.2.2.5 Stop()

```
virtual void Interpolactic.Interpolation.Runner.Stop ( ) [virtual]
```

Stops the [Runner](#) and frees all of its resources.

Calls the interpolation's onStop action, if defined.

3.2.3 Member Data Documentation

3.2.3.1 interpolation

```
Interpolation Interpolactic.Interpolation.Runner.interpolation [protected]
```

The [Interpolation](#) model for the [Runner](#)'s behavior.

3.2.4 Property Documentation

3.2.4.1 finished

```
bool Interpolactic.Interpolation.Runner.finished [get]
```

Whether the [Runner](#) has been allowed to run to completion. This will always be "false" for runners of repeating Interpolations.

3.2.4.2 playing

```
bool Interpolactic.Interpolation.Runner.playing [get]
```

Whether the [Runner](#) is currently animating.

3.2.4.3 started

`bool Interpolactic.Interpolation.Runner.started [get]`

Whether the [Runner](#) has begun to play.

3.2.4.4 stopped

`bool Interpolactic.Interpolation.Runner.stopped [get]`

Whether the [Runner](#) was stopped manually via [Stop\(\)](#).

The documentation for this class was generated from the following file:
